DETAILED ACTION

Information Disclosure Statement

1. Applicant submitted an NPL document (see attached document) that was not listed on the information disclosure statement filed 04/09/2004, and does not appear to be part of any of the other NPL documents submitted. The document has not been considered by the examiner.

Claim Objections

2. Claims 1 and 120 objected to because of the following informalities:

Referring to the preamble, it has been held that the recitation that an element is "adapted to " perform a function is not a positive limitation but only requires the ability to so perform. It does not constitute a limitation in any patentable sense (In re Hutchinson, 69 USPQ 138). Because of this, the limitation "said AC voltage source" recited in the body of the claim has been given no patentable weight.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Application/Control Number: 10/722,835 Page 3

Art Unit: 2837

4. Claims1, 2,9,12-15 and18 are rejected under 35 U.S.C. 102(b) as being anticipated by Karwath (US 6008602).

Claim 1: An electronically commutated motor (10) that is adapted to be powered from an AC voltage source (28,30 it has been held that the recitation that an element is "adapted to " perform a function is not a positive limitation but only requires the ability to so perform. It does not constitute a limitation in any patentable sense. In re Hutchinson, 69 USPQ 138) and that comprises: a stator (11); a rotor (14); a rectifier (44) which serves to generate, a pulsating DC operating voltage, a DC link circuit (46,52) with positive and negative leads, said pulsating DC voltage from said rectifier being applied between said positive and negative leads, a bridge circuit (Fig. 3:100,102,104,106), connected to the DC link circuit (46,52) and serving to supply current to the at least one winding phase, said bridge circuit comprising a switching element (100,102,104,106) that is controllable by a control voltage that is lower than the operating voltage to be switched by said switching element (Abstract, Claim 1); and an auxiliary circuit (66,68,70) for generating, from the pulsating DC voltage at the DC link circuit (46,52) and from the AC voltage (28,30) said control voltage for controlling the switching element (100,102,104,106), said control voltage being lower than the pulsating DC voltage by a predetermined voltage difference (Abstract; Claim 1).

Claim 2: the switching element is a p-channel MOSFET (Fig. 3: 100,102,104,106) having a source electrode which is connected to the positive lead of the DC link circuit (46,52) and having a gate electrode to which the control voltage is applied.

Art Unit: 2837

Claim 9: a commutation logic unit (16,18), and a plurality of control elements (Fig. 3:110,112) adapted to be controlled by said commutation logic unit (20) (it has been held that the recitation that an element is "adapted to " perform a function is not a positive limitation but only requires the ability to so perform. It does not constitute a limitation in any patentable sense. In re Hutchinson, 69 USPQ 138) and which in turn serve to control the switching element (100,102,104,106).

Claim 12: An electronically commutated motor (10) that is adapted to be powered from an AC voltage source (28,30, it has been held that the recitation that an element is "adapted to " perform a function is not a positive limitation but only requires the ability to so perform. It does not constitute a limitation in any patentable sense. In re Hutchinson, 69 USPQ 138) and that comprises: a stator (11); a rotor (14); a rectifier (44) which serves to generate, a pulsating DC operating voltage, a DC link circuit (46,52) with positive and negative leads, said pulsating DC voltage from said rectifier being applied between said positive and negative leads, a bridge circuit (Fig. 3:100,102,104,106), connected to the DC link circuit (46,52) and serving to supply current to the at least one winding phase, said bridge circuit comprising MOSFETs (100,102,104,106); and an auxiliary circuit (66,68,70) for generating, that is negative with respect to the positive lead of the DC link and renders a p-channel MOSFET conductive (col. 4:18-30).

Claim 13: the auxiliary voltage is generated at a first capacitor (Fig. 2:70) one electrode of which has a potential of the positive lead of the DC link (Fig. 2: +12V).

Claim 14: a zener diode (Fig. 2: 68) in parallel with the first capacitor (70).

Claim 15: a resistor (66) in parallel with the first capacitor.

Claim 18: bipolar transistors (110,112) controlled by a commutation logic unit, (18,16).

Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 3-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Karwath as applied to claim1 above, in view of Eckardt et al (WO200250897).

Claim 3: Karwath teaches the limitations of claim 1. Referring to claim 3, Karwath does not teach the auxiliary circuit further comprises a first capacitor, connected in series with a diode (102) between the positive lead (30) of the DC link (15) and a first one (106) of two terminals of said AC voltage source. Eckardt et al teach an auxiliary circuit comprises a first capacitor (Fig. 9:c2), connected in series with a diode (D) between the positive lead (30) of the DC link (C1) and a first one of two terminals of said AC voltage source (18). It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the apparatus of Karwath to use the auxiliary circuit of Eckardt et al. The advantage of this would be a low cost method of controlling the amount of current applied to the motor.

Application/Control Number: 10/722,835 Page 6

Art Unit: 2837.

Claim 4: Karwath and Eckardt et al teach the limitations of claim 3. Referring to claim 4, Eckardt et al teach a voltage limiter (Fig. 9:60,62) in parallel with the first capacitor (Fig. 9:C2).

Claim 5: Karwath and Eckardt et al teach the limitations of claim 4. Referring to claim 5, Eckardt et al teach a zener diode (Fig. 9:60,62).

Claim 6: Karwath and Eckardt et al teach the limitations of claim 3. Referring to claim 6, Eckardt et al teach a resistor (Fig. 9:56) in parallel with the capacitor (c2).

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Renata McCloud whose telephone number is (571) 272-2069. The examiner can normally be reached on Mon.- Fri. from 8 am - 5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Martin can be reached on (571) 272-2800 ext. 4. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
